More Exercises

## Back in control

Even though C is a sequential programming language, the program flow can branch. Use conditions to determine the behaviour of your program in certain situations.

Executing the same task multiple times can be achieved using loops.

## if...else

To make decisions during run time, you can use the truth value of an expression:

```
if (condition)
    statement1;
else
    statement2;
```

Now **statement1** is only executed if the truth value of **condition** is *true*. Otherwise **statement2** is executed. The *else* part is optional.

For multiple statements in the *if* or *else body*, use braces:

```
if (condition) {
    statement1;
    statement2;
}
```

## else if

To differentiate between more than two cases, you can use the if condition as a statement in the else body:

```
if (condition1)
    statement1;
else if (condition2)
    statement2;
else if (condition3)
    statement3;
else
    statement4;
```

## switch

If you have to check one variable for many constant values, *switch case* is your friend:

```
switch (variable) {  
    case option1: statement1; break;  
    case option2: statement2; break;  
    case option3: statement3; break;  
    default: statement4; break;  
}
```

- ▶ *case option* defines a jump label
- ▶ More than one statement after it possible without braces
- ▶ All statements until the next *break*; will be executed

## A few words on style

- ▶ Typing **if (cond)** instead of **if(cond)** helps people to differentiate between control structures and function calls faster
- ▶ When starting a new block, you should type `) {` rather than `) {`
- ▶ Don't start a new block for a single statement
- ▶ Don't put statements and conditions on the same line

```
if(cond){ statement; } /* bad style */

if (cond) {                /* looks better, still bad style */
    statement;
}

if (cond)
    statement;             /* looks way clearer */
```

## More words on style

- ▶ if you use a block anywhere in an **if ... else** structure, put all blocks of this structure in braces

```
if ( cond)           /* bad style , inconsistent */
    statement;
else {
    statement;
    statement;
}

if ( cond) {         /* way better style */
    statement;
} else {
    statement;
    statement;
}
```

- ▶ notice: the *else* is on the same line as the closing if body brace

# Calculator

- ▶ Write a Program, that takes two numbers and an operator (+, -, /, \*, %) as input and prints the result.
- ▶ **Experts:** The program should also accept the words *add*, *subtract*, *multiply*, *divide* and *remainder* as operators.

# Calculator

- ▶ Write a Program, that takes two numbers and an operator (+, -, /, \*, %) as input and prints the result.
- ▶ **Experts:** The program should also accept the words *add*, *subtract*, *multiply*, *divide* and *remainder* as operators.
  - ▶ Hint: look at the difference between the words.

# Calculator

- ▶ Write a Program, that takes two numbers and an operator (+, -, /, \*, %) as input and prints the result.
- ▶ **Experts:** The program should also accept the words *add*, *subtract*, *multiply*, *divide* and *remainder* as operators.
  - ▶ Hint: look at the difference between the words.
  - ▶ Hint: how many letters do you have to check?

# Feedback

- ▶ Write a program, that asks the user to enter a character and answers whether the input is a letter, a number, or a special char.
- ▶ **Experts:** If the character is a small letter, also print the capital letter and vice versa.

# Feedback

- ▶ Write a program, that asks the user to enter a character and answers whether the input is a letter, a number, or a special char.
  - ▶ Hint: have a look at the ASCII code table
- ▶ **Experts:** If the character is a small letter, also print the capital letter and vice versa.

# Feedback

- ▶ Write a program, that asks the user to enter a character and answers whether the input is a letter, a number, or a special char.
  - ▶ Hint: have a look at the ASCII code table
- ▶ **Experts:** If the character is a small letter, also print the capital letter and vice versa.
  - ▶ Hint: have a closer look at the ASCII code table

# Loops

To repeat statements until a certain condition is met, C offers 3 different loops.

```
while (condition)  
    statement;
```

```
do  
    statement;  
while (condition);
```

```
for (initialization; condition; statement)  
    statement;
```

For multiple statements again, use braces.

# while

The execution of a loop is a continuous alternation between checking if the condition is still met and executing the statement(s).

```
1 int i = 2;  
2 while (i > 0)  
3     i--;  
4 printf("done\n");
```

# while

The execution of a loop is a continuous alternation between checking if the condition is still met and executing the statement(s).

```
1 int i = 2;  
2 while (i > 0)  
3     i--;  
4 printf("done\n");
```

1. Check ( $i > 0$ ) → **true** → go to line 3

# while

The execution of a loop is a continuous alternation between checking if the condition is still met and executing the statement(s).

```
1 int i = 2;  
2 while (i > 0)  
3     i--;  
4 printf("done\n");
```

1. Check ( $i > 0$ ) → **true** → go to line 3
2. Decrement  $i$  →  $i$  now is **1**, go back to line 2

# while

The execution of a loop is a continuous alternation between checking if the condition is still met and executing the statement(s).

```
1 int i = 2;  
2 while (i > 0)  
3     i--;  
4 printf("done\n");
```

1. Check ( $i > 0$ ) → **true** → go to line 3
2. Decrement  $i$  →  $i$  now is **1**, go back to line 2
3. Check ( $i > 0$ ) → **true** → go to line 3

## while

The execution of a loop is a continuous alternation between checking if the condition is still met and executing the statement(s).

```
1 int i = 2;  
2 while (i > 0)  
3     i--;  
4 printf("done\n");
```

1. Check  $(i > 0) \rightarrow \text{true} \rightarrow$  go to line 3
2. Decrement  $i \rightarrow i$  now is **1**, go back to line 2
3. Check  $(i > 0) \rightarrow \text{true} \rightarrow$  go to line 3
4. Decrement  $i \rightarrow i$  now is **0**, go back to line 2

# while

The execution of a loop is a continuous alternation between checking if the condition is still met and executing the statement(s).

```
1 int i = 2;  
2 while (i > 0)  
3     i--;  
4 printf("done\n");
```

1. Check ( $i > 0$ ) → **true** → go to line 3
2. Decrement  $i$  →  $i$  now is **1**, go back to line 2
3. Check ( $i > 0$ ) → **true** → go to line 3
4. Decrement  $i$  →  $i$  now is **0**, go back to line 2
5. Check ( $i > 0$ ) → **false** → go to line 4

## while

The execution of a loop is a continuous alternation between checking if the condition is still met and executing the statement(s).

```
1 int i = 2;  
2 while (i > 0)  
3     i--;  
4 printf("done\n");
```

1. Check  $(i > 0) \rightarrow \text{true} \rightarrow$  go to line 3
2. Decrement  $i \rightarrow i$  now is **1**, go back to line 2
3. Check  $(i > 0) \rightarrow \text{true} \rightarrow$  go to line 3
4. Decrement  $i \rightarrow i$  now is **0**, go back to line 2
5. Check  $(i > 0) \rightarrow \text{false} \rightarrow$  go to line 4
6. Print **done**

## Meanwhile...

Be careful, this

```
while (1 > 0)
    printf("Did you miss me?\n");
```

runs till the end of all days.

∞ loops are common mistakes, and you will experience many of them.  
Check for conditions that are always true.

## do...while

The difference between *do...while* and *while* is the order of executing the statement(s) and checking the condition.

The *while* loop begins with checking, while the *do...while* loop begins with executing the statement(s).

```
int i = 3;
do
    i--;
while (i < 1);
```

The Statement(s) in a *do ... while* loop are executed at least once.

# for

The For-Loop is comfortable for iterating. It takes three arguments.

- ▶ Initialization
- ▶ Condition
- ▶ Iteration statement

To understand how it's working, consider a program printing the numbers 1 to 10:

```
int i;  
for (i = 1; i <= 10; i++)  
    printf("%d\n", i);
```

- ▶  $i$  is called an *index* which iterates from the given start to a given end value
- ▶  $i, j, k$  are commonly used identifiers for the index

## Saving code lines

You can define variables inside the initialization part of a for loop.

```
for (int i = 1; i <= 10; i++)  
    printf("%d\n", i);
```

In that case, the variable is only available inside the for loop (as if it was declared in the body).

But you have to compile the program with `-std=c99`

```
gcc main.c -Wall -std=c99
```

## forever

The arguments for the *for loop* are optional. E.g. if you already have defined your iterating variable:

```
int i = 1;
for (; i <= 10; i++)
    printf("%d\n", i);
```

Or if you have the iteration statement in your loop body:

```
for (int i = 1; i <= 10;)
    printf("%d\n", i++);    /* why not using while? */
```

And if you're not passing anything, it runs **forever**:

```
for (;;)
    printf("I'm still here\n");
```

Note: the semicolons are still there.

# Cancelling loops

## *break*

- ▶ Ends loop execution
- ▶ Moves forward to first statement after loop

## *continue*

- ▶ Ends current loop iteration
- ▶ Moves forward to next step of loop iteration
  - ▶ *while*: Jumps to condition
  - ▶ *for*: Jumps to iteration statement

## A few words on style

- ▶ Again, only use braces when there's more than one statement
- ▶ If you skip the loop body
  - ▶ Leave a comment in your code
  - ▶ Use an extra line for the empty statement

```
for (i = 1; i < 9; printf("%d\n", i++));    /* confusing */  
  
for (i = 1; i < 9; printf("%d\n", i++))    /* clear */  
;    /* do nothing */
```

## Customized Sheldon

- ▶ Write a program, that lets the user decide how often "*Knock, knock, knock - Penny?*" is printed.
- ▶ **Experts:** Let the program additionally ask how often Sheldon knocks each time.
  - ▶ Take care, that the first "Knock" starts with a Capital K

## Customized Sheldon

- ▶ Write a program, that lets the user decide how often "*Knock, knock, knock - Penny?*" is printed.
- ▶ **Experts:** Let the program additionally ask how often Sheldon knocks each time.
  - ▶ Take care, that the first "Knock" starts with a Capital K
  - ▶ Hint: You can use loops inside loops

## Customized Sheldon

- ▶ Write a program, that lets the user decide how often "*Knock, knock, knock - Penny?*" is printed.
- ▶ **Experts:** Let the program additionally ask how often Sheldon knocks each time.
  - ▶ Take care, that the first "Knock" starts with a Capital K
  - ▶ Hint: You can use loops inside loops
  - ▶ Hint: You should use a different index for the inner loop

# Power and faculty

- ▶ Write a program that takes two numbers  $a, b$  from the user and calculates  $a^b$  and  $b^a$
- ▶ **Experts:** Write a program that calculates the factorial of the user input.

## Power and faculty

- ▶ Write a program that takes two numbers  $a, b$  from the user and calculates  $a^b$  and  $b^a$
- ▶ **Experts:** Write a program that calculates the factorial of the user input.
  - ▶ Hint: The factor changes in each step.

# The rabbit problem

- ▶ Write a program, that prints the  $n$ th fibonacci number.
  - ▶ A fibonacci number is the sum of its two predecessors in the fibonacci sequence
  - ▶ The fibonacci sequence starts with 0,1,...
- ▶ **Experts:** Also calculate the sum of all fibonacci numbers  $\leq n$ .

# The rabbit problem

- ▶ Write a program, that prints the  $n$ th fibonacci number.
  - ▶ A fibonacci number is the sum of its two predecessors in the fibonacci sequence
  - ▶ The fibonacci sequence starts with 0,1,...
  - ▶ Hint: One variable is not enough to store all the information you need to calculate the next fibonacci number.
- ▶ **Experts:** Also calculate the sum of all fibonacci numbers  $\leq n$ .
